ABSTRACT OF THE DISCLOSURE

relates invention to new The present essential downstream component of the Wnt/Wingless signaling pathway and therapeutic and (Wnt/Wq) The diagnostic applications based thereon. invention relates to nucleotide sequences of Drosophila melanogaster legless (lgs) gene, of encoded proteins, as well as derivatives fragments) and analogues thereof. The invention invertebrate includes vertebrate and homologues of the Lgs protein, comprising proteins that contain a contiguous stretch of amino acids with similarity to the Drosophila lgs gene. The invention further relates to the function of Drosophila and the human Lgs proteins. Methods for producing the Lgs proteins, derivatives and analogs, e.q., by recombinant means and antibodies to Lgs are provided by the present invention. In addition, the invention also relates to the therapeutic and diagnostic methods and compositions based on proteins and nucleic acids or fragments thereof.
